🧪 Practice — Don't look at the answers

Try these yourself.

Question 1

Create this NumPy array:

```
[5 10 15 20 25]
```

Question 2

Create an array containing:

```
0 1 2 3 4 5 6 7 8 9
```

using `np.arange()`.

Question 3

Create:

```
[[1 2 3]
 [4 5 6]]
```

using `np.array()`.

Then find:

```
shape
ndim
size
```

Question 4

Take:

```
numbers = np.array([1, 2, 3, 4, 5, 6])
```

Convert it into:

```
[[1 2]
 [3 4]
 [5 6]]
```

using `reshape()`.

Question 5

Convert:

```
[[1 2]
 [3 4]
 [5 6]]
```

back into:

```
[1 2 3 4 5 6]
```

using `flatten()`.

Question 6

Create a **3 × 4** array containing only zeros.

Question 7

Create **10 evenly spaced values between 0 and 100** using `linspace()`.

Question 8

Create a **5 × 5 array of random integers between 1 and 50**.

Question 9 — Think like an ML engineer

Suppose:

```
X = np.array([
    [20, 4, 80],
    [21, 6, 90],
    [19, 2, 65],
    [22, 8, 95]
])
```

Answer:

```
How many records are there?
How many features are there?
What is X.shape?
What is X.ndim?
What is X.size?
```
